

To Whom It May Concern,

I've taught Cody Holland in several of my courses. He has a very good grasp of data structures and programming in general as evidence by the projects he has done in my courses and, more recently, work that he did for me over the past summer. Cody worked with me on a Java project I created that is about 4,000 lines of code. He was able to look through the code, familiarize himself with it and add several features to it. He even fixed some bugs of mine. The project demanded deep understanding of data structures, string manipulation and generics. Cody showed that he has each of these skills and actually surprised me with the work that he did. He surpassed my expectations both with his excellent work ethic as well as his programming skill. I would easily put him at the top 10% of computer science students. Now that he has graduated, he is going to be a great asset to any company.

Sincerely,

A handwritten signature in cursive script that reads "Kevin Cherry".
